TECHQUITY

Internal Assessment Resource

Digital Technologies: Level 1

This resource supports assessment against Achievement Standard 92005

Standard title: Develop a digital technologies outcome

Credits: 5 Credits

Resource title: **My Website**

Authenticity of evidence	Assessor involvement during the assessment event is limited to providing general feedback which suggests sections of student work that would benefit from further development or skills a student may need to revisit across the work. Student work which has received sustained or detailed feedback is not suitable for submission towards this Standard.

Student/Ākonga instructions

Introduction

This document supports the teaching and learning contained in:

https://www.secondary.techquity.co.nz/level-1/l1-website-project/website-outcome

Follow the website for instructions and complete this document as you go.

You are going to design and make a website using Figma, HTML and CSS, Github and Visual Studio Code over 6 weeks.

You will make this website entirely in HTML and CSS. CSS Frameworks are not to be used. You may also use ‘vanilla’ JavaScript to make your websites interactive. Libraries or other packages are not to be used and all scripts must be ‘client side’.

Please ensure you have a sound grasp of HTML, CSS and JS before attempting this assessment. It is highly recommended that you have completed all the work on this page before attempting this assessment.You will be expected to be able to follow basic software engineering and web development conventions during this project.

Conventions include but are not limited to:

- Using an organised file structure for your project files
- Using well named files and folders in your project
- Using code comments where appropriate
- Following common language conventions for HTML (info here)
- Following common language conventions for CSS (info here)
- Following common language conventions for JS (info here)
- Using version control including descriptive commit messages

You are encouraged to incrementally develop your website through weekly iterations of “plan-develop-test”, keeping a record of your progress as you go. Git Version control and your Kanban Board should be used as evidence of this.

If you are unable to use git, multiple files in your source code folder must be made with version number included.

You will submit the working website (hosted on github or a zip of your entire source code folder) as well as this document for assessment against the criteria listed above.

It is recommended that your project be structured around an interactive quiz or study guide for a subject you are passionate about. Make sure you correctly identify the appropriate target audience for the content. Examples include:

- A chemical elements quiz.
- A Te Reo Māori translation test
- A music notes flashcard game

Complete the following questions.

Before Development

What is the purpose of this website

To help junior umpires learn, understand the fundamentals for umpiring intermediates. This provides an interactive way for umpires to learn the rules creating more universal umpiring for the Waikato intermediate team.

Who might use this Website?

Coaches, managers and umpires of intermediate teams in their respective grades

What are the requirements and specifications for this website?

Requirements	**Specifications**
Inform intermediate umpires of the rules and the rule changes depending on the grade. It will also provide a contact at waikato hockey	This website should have photos that are of field hockey and of intermediate grades when needed. This website should be written in HTML and CSS It should be hosted by github. All text should be readable and easy to see.

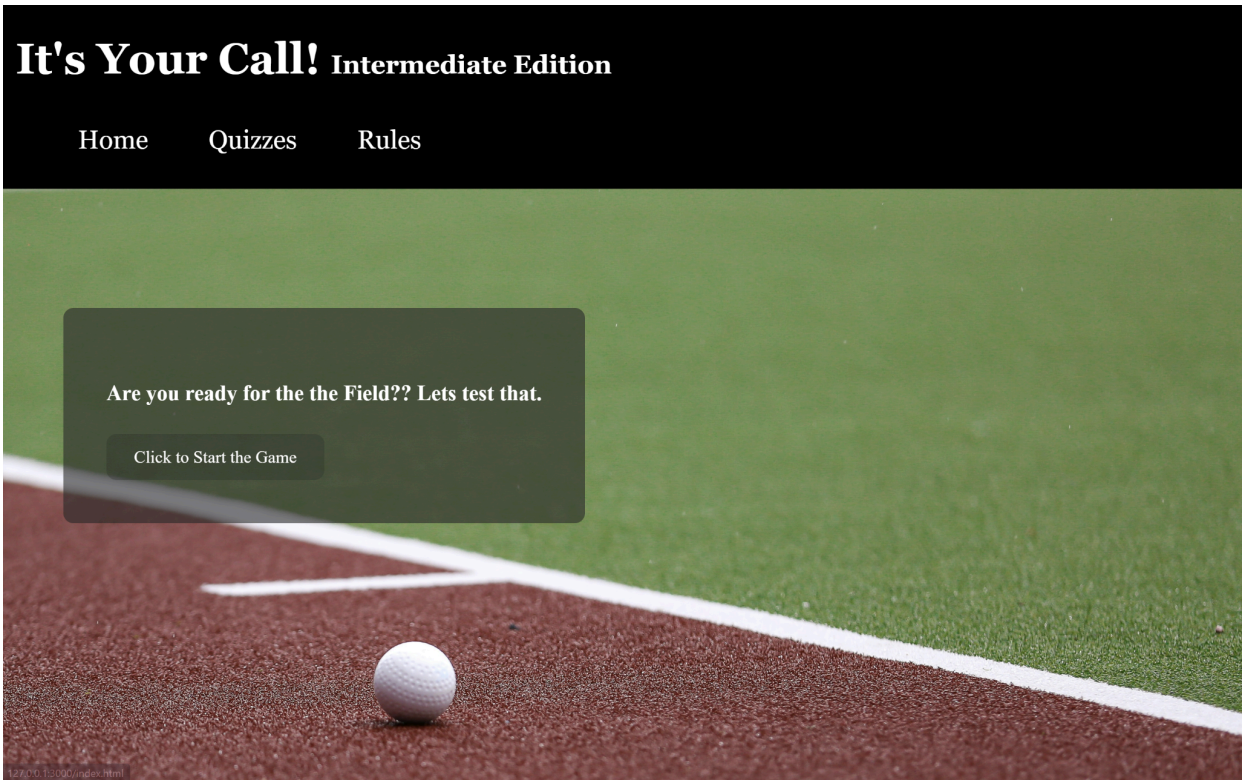
Develop Your Website

At the end of each sprint you must test your website with at least three people. The more the better! Take a few screenshots of the site at this stage as your showcase and summarise the feedback that you got from people so that you can work out what to do next and how to make your website better.

Showcase Version 1

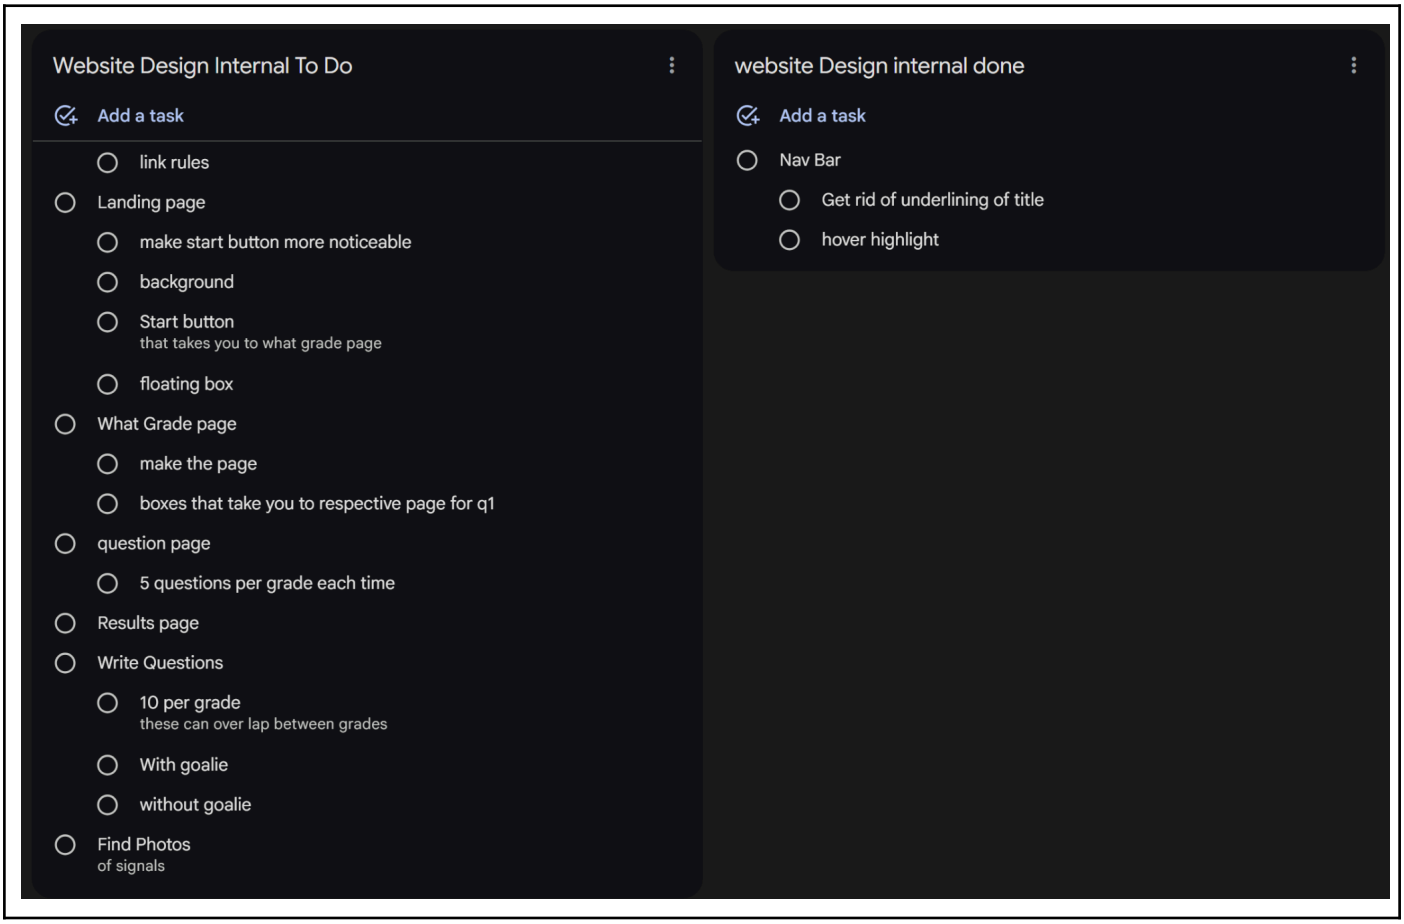
Date: 14/10/26
Insert Picture of site at this stage of development. Get feedback on the site at this stage to help you to make improvements



Summary of Feedback and next steps

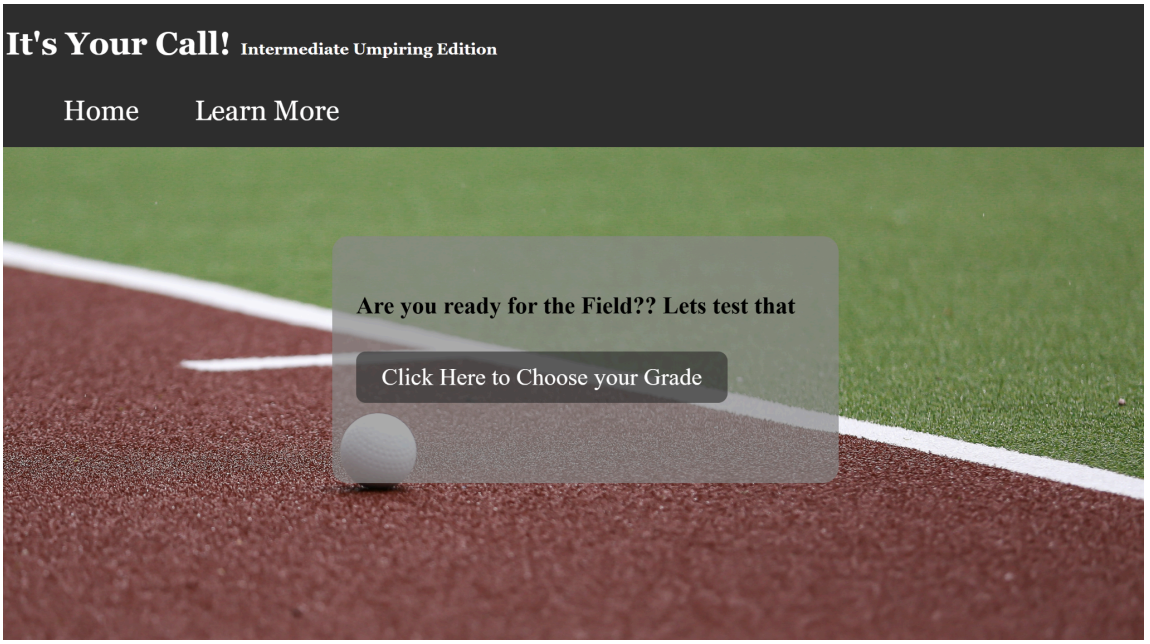
In my first round of feedback I was told by Jayean that in order to make my website more readable I should make the start button more noticeable against the text box, to do this I will change the background colour of the text box to a lighter grey or make the start button darker. Liana said I should add sounds to my buttons if I have time I might but I haven't started javascript at this point so I will see how the rest of the HTML and CSS goes before adding sounds or extra layers to the website.

Updated Planning Board- what my board looks like now.



Showcase Version 2

Date: 18/10/26
Insert Picture of site at this stage of development. Get feedback on the site at this stage to help you to make improvements

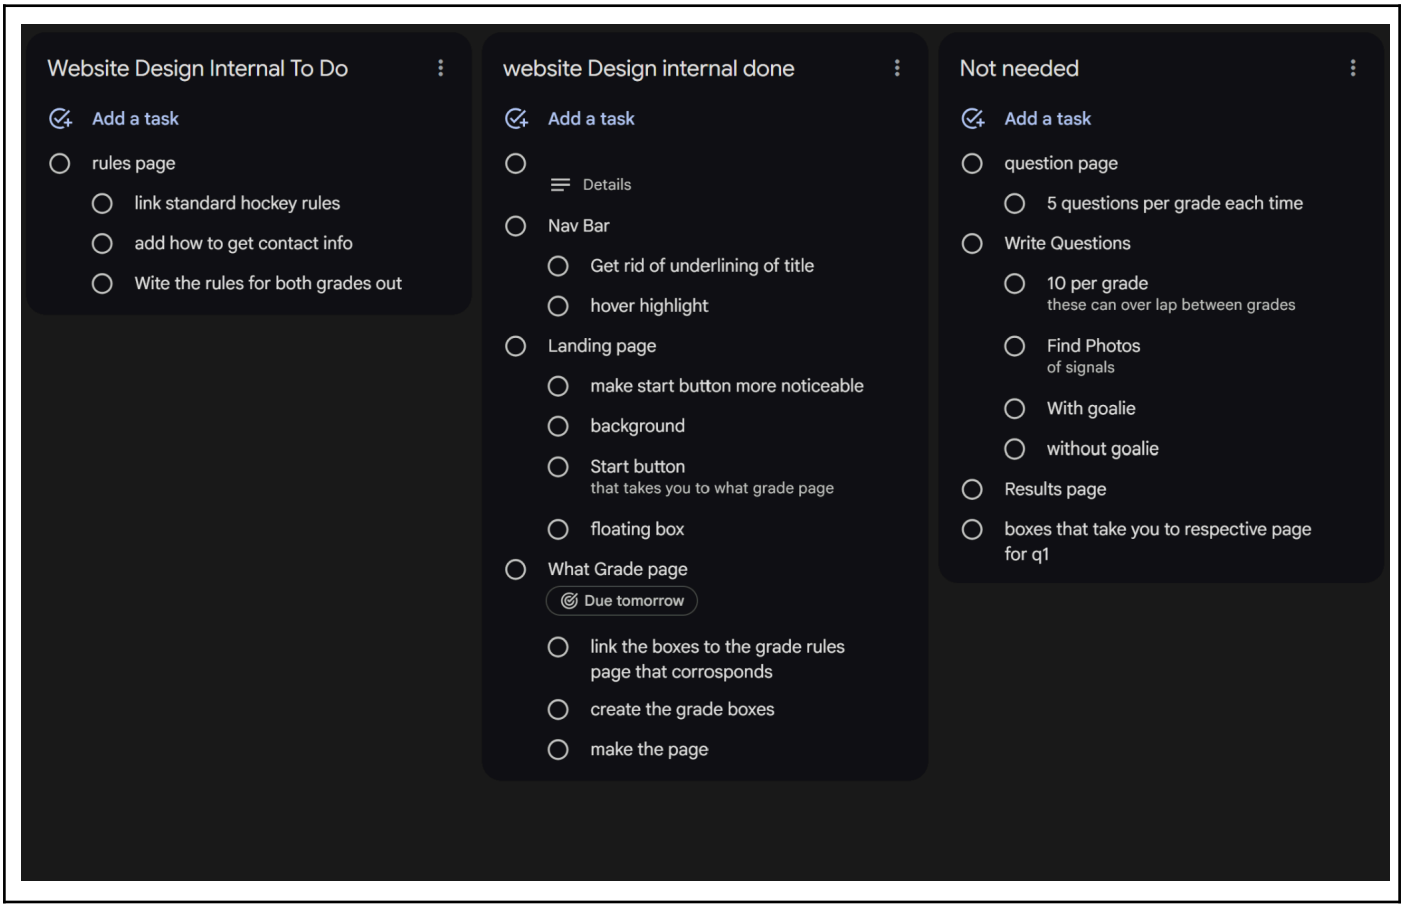


Summary of Feedback and next steps

The feedback I received from Charlotte was:
That the images stretch on grade selection page so I have to find out how to keep the size the same and just have it crop instead over stretching
She also said to keep the text all the same colour on the body section of the page so for the landing page I should make the text block darker and make the currently black font into white to match the button font colour.

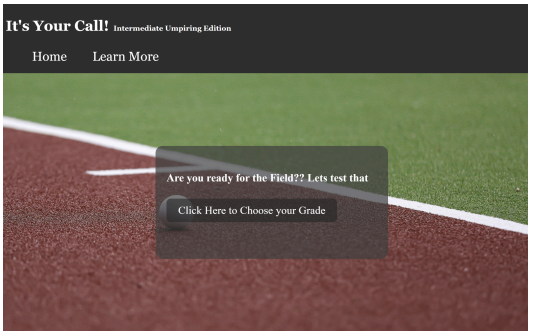
At this point I have pivoted away from making a quiz so I can focus on getting a finished project, so I am now creating an information site which will still serve the same purpose I outlined originally, but it just won't have the interactive aspect of the original design. I have also been advised to not start javascript this late into my project.

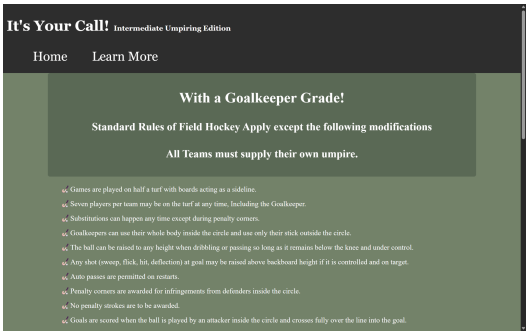
Updated Planning Board- what my board looks like now.

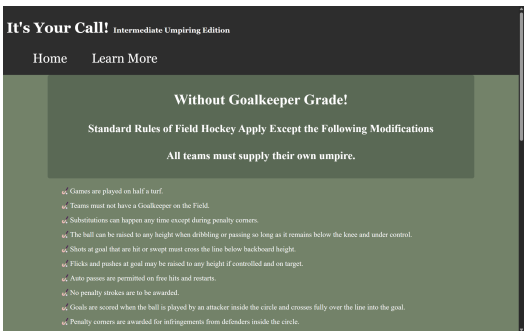


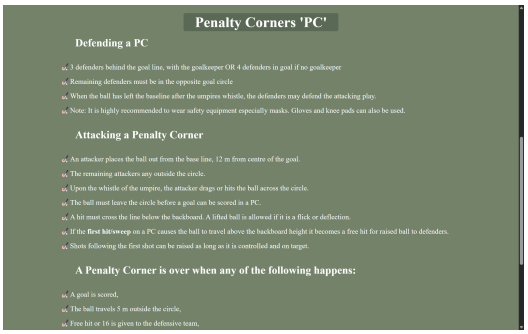
Showcase Final Version

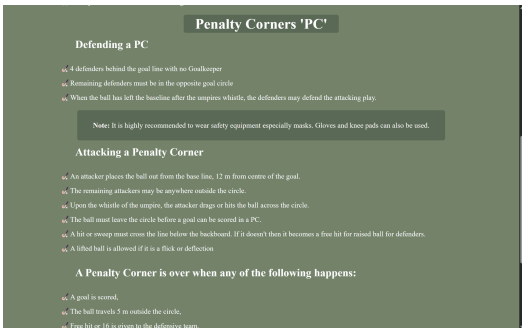
Date: 23/10/26
Final Version. Add screenshots of the final website.

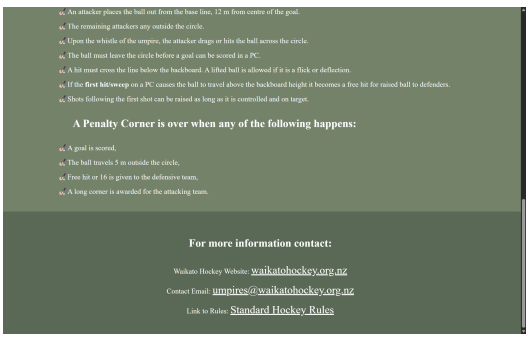


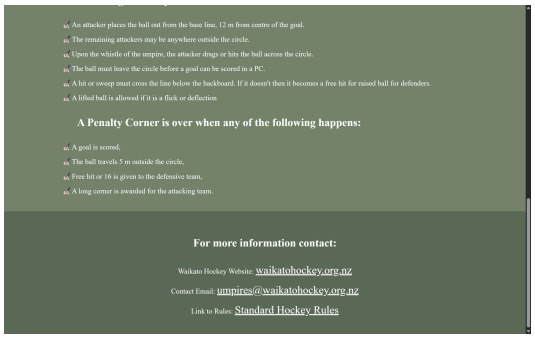












Final Reflection on Website

Long answer. For excellence include evidence of how you tested and trialled the outcome with others and how, with examples, this helped you to make the website better. What cool techniques or tools did you use to make the website stand out and meet the requirements that you intended at the start.

While I was producing my information website I was continuously testing and trailing everything I did to make sure it worked before I moved on to the next part I wanted to work on. When I started, I worked on creating my nav bar. It took a bit of trial and error to get the colour right and for the title and subtitle to sit in the right spot. This was the first problem I encountered was that I couldn't get the subtitle to sit smaller but still next to the main title, to fix this I used the HTML tag and gave it the class "subtitle" and change the size in CSS while keeping both titles on the same line.
 	
I also had difficulty sorting the background so it stayed still while not being too zoomed in, to do this I had to create to parts of CSS to control it because the body tag CSS work for the which grade but not for my landing page, so I add a class for that page of hero-box and kept the same code as that was in the body and it fixed my problem. That solution mostly required trial and error and trying just a bunch of different things.
 	
After I created the page for the user to choose which grade they wanted to do a quiz on I was told it was quite late to start java script so I pivoted my attention to just create a website with the rules clearly displayed and in a way that is easier to understand, this is how my website went from a quiz to an information site. For my website because I didn't have any java script I decided not to include the button sounds that were suggested to me in my first round of feedback. I also then had a chance to focus on my HTML and CSS, which meant I could use little details to make my website more interesting.
 	
In the last stages of making my website I replace the bullet points to be an emoji of a hockey stick to match the overall theme. To do this I use "ul:: marker" and ' content: "🏑" ' . I also made the decision to have a solid colour as my background for the pages with the written rules instead of the image, I did this so It would be easier to read and more cohesive. I also encountered a problem with the image and that on different devices it would stretch, but I added a line of CSS for the image to keep it in the box which was " object-fit: cover; ".
 	
I used a code I found on W3schools for creating a polaroid effect on the which grade page for my image, I personally like this effect because it looks contained and simple.
 	
Collectively I think this makes my website look cohesive while keeping it to the purpose of my original design and want for this website. I think that the way I have written the rules is more understandable and directed towards young and new umpires. This makes me think I have achieved my original purpose.
 	
`/*this makes the bullet point into an emoji of a hockey stick*/`
`ul ::marker{`
`  content: "🏑";`
`}`
My bullet point was changed to a hockey stick emoji.

This is my example of how the polaroid effect on my image turned out.

```css
img {
  width: 100%;
  height: 400px;
  object-fit: cover;
}
```

The line of code I added for the image in the CSS.

For Teacher Use

Develop a digital technologies outcome

Domain: Digital Technology 1.2
Standard: AS92005 v1
Credits: 5 (Internal)
Link: https://ncea.education.govt.nz/technology/digital-technologies/1/2?view=standard

Achieved **Develop a digital technologies outcome**	**Comments**	
Identifying the purpose, potential users, requirements, and specifications of the outcome	Complete section "Before Development" correctly	
Using appropriate tools and techniques of a digital technologies domain to produce an outcome that addresses the requirements and specifications	Use HTML and CSS in an appropriate IDE to create a website from a design that looks and functions as expected and hand it in on time Handed in all project code as a github link or as zip file. May not have used github Final project may not look like exactly like design	
Testing the outcome to ensure basic functionality.	Teacher observation of testing and the website looks and functions mostly as expected May not have feedback or may not have acted on feedback during development	
Merit **Refine a digital technologies outcome**		
Following relevant conventions of a digital technologies domain	Conventions include: ● Organised file structure ● Well named files and folders ● Code comments where appropriate ● Language conventions for HTML ● Language conventions for CSS ● Effectively using version control including descriptive commit messages Checked and passing against https://validator.w3.org/	
Using information from testing to make improvements to the outcome's fitness for purpose.	Did testing and got feedback. Made some improvements to work towards the suggested improvements.	
Excellence **Enhance a digital technologies outcome**		
using information from trialling the outcome with others to improve its fitness for purpose	Lots of improvement through at least three versions. Including relevant feedback from others and implementing suggested changes where appropriate.	
applying tools and techniques effectively in the production of a fit-for-purpose outcome.	The final outcome meets the design and specifications and shows an excellent grasp of HTML/CSS to create an above average website that follows all conventions
